

# The X Factor

## What is the X Factor?

### What is the X Factor?

The X-Factor is the term coined to describe the result of tension at all corners and connection points of an XPRESSIONS® skin, when on a frame. The artwork on any skin will then be stretched, with the least amount of distortion at the very center of the skin, and the most amount within the outer 3-5 inches of the skin.

### Is it a "live area"?

NO. The X-Factor is not a live area. The definition of a live area is any artwork that falls within the visual area of a print. The entire skin is a visual area, it is just distorted by the nature of the product.

### Does it have to be distorted?

YES. Because the fabric is under tension as soon as the frame is set up, the printed artwork will always be distorted. If a lesser degree of distortion is required then a non-stretch material can be used, but it does not eliminate the distortion effect completely.

### What if I don't want it distorted?

If no distortion is a requirement for the artwork being printed, and a pop-up solution is also a requirement for the project, then a V-Burst™ is recommended in place of an Xpressions® frame.

### Examples.

For every quad, there is an X-Factor distortion effect. A 1x1 skin has 1 X-Factor, where a 2x2 skin has 4.
